Scientists contribute more to society, so scientific students should get more support. Do you agree or disagree?

A number of useful innovations are created by scientists including new medicines, machines, and facilities. It is clearly to infer that scientists bright about better life to the society. On one hand, I strongly agree that the scientific students should be provided more support financially, instrumentally, and mentally because they are the primary resources for scientific development. On the other hand, students in any other field should not be ignored since they can also make contribution to the public together with scientific students.

In the aspect of agreement, scientific students are required to study longer than students in any other fields such as medical students in order to be experts on their own area. Therefore, they must spend more money on their tuition fees in each academic year. Giving financial support for them can help students less likely to be worried about their expenses and focus more on their researches. Moreover, scientific students should have the effective equipments for the effective outcomes. In consequence, they should get quality instruments for doing their experimental projects. Furthermore, as individuals should be rewarded for what they succeed, scientific students should also receive the recognition for their works from the society as well.

Turning to the aspect of disagreement, students in other fields also need to be encouraged as well as scientific students since they make social contribution to the public. For instance, students in the area of social welfare can be able to help people in terms of knowledge about well-being. Moreover, the society requires the innovations both scientifically and socially.

In the final analyses, scientific students should get more support to contribute more to the society. Nevertheless, if students in other fields can also be encouraged especially to work with scientific students, the public can gain more benefit.
